

Insulated Coolers

Gel-packs and other insulated coolers are a necessity when it comes to shipping and packaging goods that require temperature control, such as perishable goods and pharmaceuticals. Gel-packs are known for their consistent cooling (or in some cases, heating) capabilities that help maintain temperature through transit as well as helps extend a product's shelf life. When combined with specialty cartons or insulated coolers, an effective barrier is created against external temperature fluctuations. Outside of the temperature control benefits, gel-packs and insulated coolers are designed to be lightweight, cost effective (due to their reusable nature), and are designed to fit containers of many different shapes and sizes.
